1936**

GROWTH OF THE REGISTRATION AREA FOR BIRTHS: 1915 TO 1936

ORIGINAL REGISTRATION STATES, 1915

STATES ADDED SINCE 1915

BIRTH, STILLBIRTH, AND INFANT MORTALITY STATISTICS: 1936

BIRTH STATISTICS: 1936

INTRODUCTION

This volume presents statistics of live births, stillbirths, and infant mortality in the United States, the Territory of Hawaii, and the Virgin Islands. The data were secured from transcripts of birth, death, and stillbirth certificates received from these areas.

As the text and general tables relate only to the United States, figures for Hawaii and the Virgin Islands are presented in special tables, as a supplement.

The number of live births reported in the United States in 1936 was 2,144,790, equivalent to a birth rate of 16.7 per 1,000 estimated population; the number of stillbirths reported was 73,735 or a ratio of 3.4 per 100 live births; and the number of deaths under 1 year of age was 122,535, corresponding to an infant mortality rate of 57.1 (deaths under 1 year per 1,000 live births).

The compilation of these data makes it possible to compare statistics for the United States with those for foreign countries. Also, light is thrown on such matters as the natural increase of populations in the States and cities, the relation between birth rates and rates of infant mortality, ratio of stillbirths to live births, etc.

This report was prepared under the direction of Dr. Halbert L. Dunn, Chief Statistician for Vital Statistics, assisted by Dr. John Collinson, Assistant Chief Statistician for Vital Statistics.

Although it has again been necessary to present this volume in condensed form, the data eliminated are available in manuscript tables on file in the Bureau of the Census.

GROWTH OF REGISTRATION AREA: 1915

TO 1936

Table A shows the year in which each State was added to the registration area for births.

TABLE A	YEAR	STATE	YEAR	STATE	YEAR	STATE
1915----						
	Connecticut Maine Massachusetts Michigan Minnesota New Hampshire New York Pennsylvania Rhode Island 1/ Vermont District of Columbia 2/	1917--	Virginia Washington Wisconsin	1925--	West Virginia

1917----	Indiana Kansas Kentucky North Carolina Ohio Utah	1924--	Florida Iowa North Dakota	1932--	South Dakota	1933--
					Texas	

1/ Dropped from the registration area in 1919; readmitted in 1921.

2/ Included in registration States.

3/ Dropped from the registration area in 1925; readmitted in 1928.

The birth registration area was established in 1915 and comprised but 10 States and the District of Columbia. Gradually, by the inclusion of other States, this area expanded until 1933 when the last State was admitted and the tables, for the first time, related to the entire continental United States. The Virgin Islands and the Territory of Hawaii became part of the registration area in 1924 and 1929, respectively.

DEFINITION OF "URBAN" AND "RURAL"

The term "urban" as used in the birth and mortality reports prior to 1930 included the population of cities having 10,000 or more inhabitants. The definition was changed in 1930 to include as "urban" the population of all cities having 2,500 inhabitants or more, the rest of the population being classified as "rural." This conforms to the established practice of the population census reports. In order, however, to facilitate comparisons with the earlier classification the urban population as thus defined is usually subdivided into two groups, one comprising the population of cities of 10,000 or more and the other that of cities from 2,500 to 10,000. The former corresponds to the urban population as previously defined in the birth reports, and the latter when combined with the rural population as now defined corresponds to the population previously designated as rural.

Unfortunately, however, in some States the Bureau of the Census did not succeed in obtaining for deaths the local detail necessary for applying the new classification and in such States the only distinction that can be shown for deaths is that between population of cities having more than 10,000 inhabitants and the remainder of the population, formerly designated as rural. Ultimately, of course, it is expected that the new classification can be made to cover all the States.

STATISTICS OF BIRTHS AND DEATHS IN 1936

BIRTHS.—In the United States in 1936 there were 2,144,790 live births, which represent a birth rate of 16.7 per 1,000 estimated population, as against 2,155,105 live births, with a rate of 16.9 reported in 1935. Of the 1936 births, 1,099,465 were males and 1,045,325 were females, or a proportion of 1,052 males to 1,000 females.

DEATHS.—The total deaths (exclusive of stillbirths) numbered 1,479,228, corresponding to a death rate of 11.5 per 1,000 estimated population; of these, 821,439 were males and 657,789 were females, or a proportion of 1,249 males to 1,000 females.

STILLBIRTHS.—There were 73,735 stillbirths in the United States in 1936, with a ratio of 3.4 per 100 live births; of these stillbirths, 40,892 were males, 31,384 were females, and in 1,459 cases the sex was not stated or was unknown. These stillbirths show a proportion of 1,303 males to 1,000 females.

INFANT MORTALITY.—Deaths of infants under 1 year of age numbered 122,535 or 57.1 per 1,000 live births, a rate 1.4 higher than the corresponding rate of 1935. Of the total deaths under 1 year of age, 69,749 were males and 52,786 were females, or a proportion of 1,321 males to 1,000 females. The infant mortality rates for the States ranged from 42.0 in Connecticut to 121.8 in New Mexico.

Table B shows births, total deaths, stillbirths, and deaths under 1 year of age, with the proportion of males to 1,000 females, from 1915 to 1936.

BIRTHS, STILLBIRTHS, AND INFANT MORTALITY

CALENDAR YEAR	UNITED STATES (BIRTH REGISTRATION AREA)																
	Births 1/				Total deaths 1/				Stillbirths				Deaths 1/ under 1 year of age

1/ Exclusive of stillbirths.

2/ Data not collected.

3/ Stillbirths of unknown sex distributed.

NOTE.—See tables A and C for growth of the registration area, etc.

The figures given in table B should be considered in relation to the growth of the birth registration area as shown in table C. Table C shows populations, births, and birth rates, in the birth registration area of the United States from 1915 to 1936. As may be seen in this table, the original birth registration area included only 31.1 percent of the population of the United States and the percent included increased gradually until 1933 when the registration area comprised the whole United States. The data given in table B refer only to the area included in the birth registration area although for the years shown in table B, mortality data were collected for a larger area. Mortality figures for the mortality registration area are published separately.

According to the census of 1930 there were 913 cities in the United States having 10,000 or more inhabitants. There were also 47 towns and 23 townships with populations of 10,000 or more and with population densities of 1,000 or more per square mile which, for statistical purposes, are also considered urban.

In 213 of these 983 places the deaths outnumbered the births. Two factors were doubtless responsible for this apparent lack of natural increase in the population: First, many of these places have a State asylum, State hospital, or similar institution in which many deaths occur; second, many of them lack maternity hospital facilities causing their expectant mothers to use other areas.

If births to nonresident mothers were allocated to the mother's residence and deaths of nonresidents were credited to the decedent's usual place of abode instead of being charged to the areas in which they occur, the number of places where deaths outnumber births would be much smaller.

COMPARISON OF BIRTH AND DEATH RATES.—In 1936 the birth rate for the United States was 16.7, exceeding the death rate (11.5) by 5.2, or 45 percent. This signifies that if these rates were to remain unchanged and if there were no migration from or into this area the natural annual increase in the population would be 5.2 per 1,000 inhabitants. In the States, the greatest excess of births over deaths (15.8 per 1,000 population) was for New Mexico. Other large excesses were 14.4 for Utah, 12.6 for Mississippi, 11.7 for North Carolina, 11.4 for West Virginia, 11.3 for North Dakota, 10.8 for Idaho, and 10.1 for Alabama and Wyoming.

COMPARISON OF BIRTH RATES, 1932 TO 1936.—The birth rate (16.7 per 1,000 population) for the United States in 1936 was 0.2 lower than that for 1935. The rates for the individual States, as compared with those for 1935, were higher in only 14 States. The largest increase (1.6 per 1,000 population) was in the rate for Wyoming. The largest decrease (1.3) was in the rate for Arkansas.

The highest rate (30.6 for New Mexico) was followed by 24.6 for Mississippi and 24.3 for Utah as the next highest. The lowest rate (12.4) was for New Jersey.

A comparison of the rates for the birth registration area from 1932 to 1936 shows a decline from 17.4 in 1932 to 16.5 in 1933. This was followed by a rise to 17.1 in 1934 after which the rate declined again to 16.7 in 1936. Comparing the rates for 1936 with those for 1932 for the 47 States that were in the area in both years, it is found that rates for only 20 States were higher in the later year.

Table D shows birth and death rates from 1932 to 1936.

CALENDAR YEAR	Population of the United States 1/	REGISTRATION AREA IN THE UNITED STATES			
		Population 1/		Births 2/	
		Number	Percent of total	Number	Per 1,000 popu- lation

1/ Estimated as of July 1.

2/ Exclusive of stillbirths.

EXCESS OF BIRTHS OVER DEATHS

In 1936 there was a substantial excess of births over deaths in every State except Nevada, where births were outnumbered by 20 deaths.

December	15.6	15.9	16.6	16.2	16.2

1/ Exclusive of Texas in 1932.

ANNUAL BIRTH RATES BY MONTHS

Table E, showing annual birth rates by months, indicates that the greatest natality occurred in the third quarter of the year, namely, July to September, inclusive. The highest rate in any month of 1936 was 17.5 for July, August, and September. The lowest rate in the same year was 15.6 for December.

A comparison of the rates for 1936 with those for 1935 shows the differences to be very slight. The only increase (0.1 per 1,000 population) was in the rate for March. The greatest decrease (0.5) was in the rates for both January and May.

BIRTHS AND DEATHS IN THE ORIGINAL REGISTRATION AREA

Table F shows birth, death, and infant mortality rates for the original birth registration area (exclusive of Rhode Island) from 1915 to 1936. Death rates for 1936 were higher and the birth rate was slightly lower than the corresponding rates for 1935.

YEAR AND AREA	THE ORIGINAL BIRTH REGISTRATION AREA (EXCLUSIVE OF RHODE ISLAND)

NOTE.—"Urban" includes municipalities with populations of 10,000 or more in 1930; "rural" includes the remainder of the area.

Some idea of the part played by the various nationalities in producing the coming generation in the registration area may be gained from table G, which shows the percent of births of white children with father, mother, or both parents born in specified country.

Of the white children born in the year 1936, 88.1 percent had native fathers, i.e., fathers born in the United States, and 92.4 percent had native mothers. The increase shown by the table in the percentage of white children born of native parents is a natural result of the check to immigration in recent years. Of all children of specified foreign parentage born in the United States in 1936, by far the largest number had parents born in Italy.

COUNTRY OF BIRTH OF PARENTS	PERCENT OF BIRTHS OF WHITE CHILDREN BORN IN THE UNITED STATES, WITH FATHER, MOTHER, OR BOTH PARENTS BORN IN SPECIFIED COUNTRY					
	1936		1935		1934	
	Father	Mother	Both parents	Father	Mother	Both parents
All countries	100.0	100.0	1/ 89.8	100.0	100.0	1/ 89.4
United States	88.1	92.4	85.5	87.3	91.6	84.6
Austria, Hungary	0.5	0.4	0.6	0.5	0.2	0.6
Canada	0.9	1.0	0.3	1.0	1.1	0.3

1/ This number excludes the percent of "mixed parentage."

2/ Less than one-tenth of 1 percent.

For the United States and certain foreign countries table H presents birth rates per 1,000 population from 1915 to 1936. Rates for 1936 are shown for 27 countries. A comparison of these rates with those for 1935 shows that only 10 countries had higher rates in the later year.

BIRTH STATISTICS

7

COUNTRY OF BIRTH OF PARENTS

Table J, in which the distribution per thousand by country of birth of father is shown for children classified by country of birth of mother, gives some idea of the extent to which the natives of the United States and various foreign countries have intermarried. Thus, of the children born in 1936 of mothers who were born in Ireland, 267 per thousand, or 26.7

percent, have fathers who were born in the United States, while 65.4 percent have fathers born in Ireland, and the remainder (7.9 percent) have fathers born in other foreign countries or in "country not stated." Of the children whose mothers were born in Canada, 66.0 percent have fathers who were born in the United States, while for the children whose mothers were born in Italy the corresponding percentage is only 18.5.

PLURAL BIRTHS

In the United States, in 1936, there were 48,123 living plural births in 24,852 cases where at least one was a live birth. There were 22,760 cases of twins where both were living at birth and 1,809 cases where only one was born alive.

In 232 cases of triplets all were born alive; in 29 cases only 2 were living; and in 16 cases only 1 was a live birth.

There were 6 cases of quadruplets in 1936 and in each case all were live births.

Tables 8 and 9 of this report relate to plural births.

Table K shows cases of single and plural births and also cases of plural births per 1,000 total cases, at specified age of parents.

The relative frequency of plural births increases with aging of the mother up to the age period, 35 to 39.

1/ Only those cases where at least 1 was a live birth.

Table L shows for the United States and each State the number of cases of plural births per 1,000 women who bore children in 1936. In Arkansas, the rate was highest, there having been 15.8 cases of plural births in that State per 1,000 mothers or confinements. The next highest rates were 15.4 for Mississippi, 14.1 for Arizona, and 14.0 for Minnesota. The lowest rate (6.4) was for Delaware.

AGE OF MOTHER AND FATHER

The ages of both parents were reported on the transcripts of birth certificates of 2,080,769 of the children born in the United States in 1936. The fathers of 61 percent of these children were in a higher age-group than were the mothers, whereas only 4 percent were in a lower-age group and 35 percent were of the same age group.

In 1936, as in previous years, the number of children whose fathers were 25 to 29 years of age, and mothers 20 to 24 was larger than that in any other group, as shown in table 5.

Table M shows the distribution of births per 1,000, by age of parents.

In table N the distribution per 1,000, by age of father, is shown for children born in 1936 classified by age of mother.

1/ Less than one-tenth of 1 per 1,000 mothers.

ILLEGITIMATE BIRTHS

Statistics relating to illegitimate births may be found in tables O and P. The ratio of illegitimate births to 1,000 total births, as shown in table O, varied in 1936 from 11.2 in Utah to 101.6 in South Carolina. The exceptionally high rates—101.6 in South Carolina, 85.4 in Mississippi, 84.4 in Louisiana, 83.4 in Alabama, 83.1 in the District of Columbia—were due to the large number of illegitimate births among the populations of other races.

A comparison of the figures for 1936 with those for 1935 shows that rates for illegitimacy in 1936 were higher in 10 States and the District of Columbia. The largest increases (7.2, 4.1, and 3.2) were for Kentucky, Arizona, and Oklahoma, respectively. The largest decrease (5.5) was for Nebraska.

2/ Less than one-tenth of 1 per 1,000 total births.

Table P shows the number of legitimate and illegitimate births by race and by nativity of mother, with the ratio of illegitimate births to 1,000 total births, in cities of 10,000 inhabitants or more in 1930, cities of 2,500 to 10,000 inhabitants, and rural districts of each State.

Although the ratio (41.8) of illegitimate births for the rural part of the United States was higher than the ratios for both the larger and the smaller cities (40.5 and 28.8, respectively), the reverse was true in 17 States, and in 18 of the remaining States the ratios for rural districts were lower than those for the larger cities.

Considering only the illegitimate births to white mothers in each State, ratios were generally highest for the larger cities. In Delaware, Kentucky, Maryland, and West Virginia, ratios were highest for the smaller cities (those having from 2,500 to 10,000 inhabitants) and in Connecticut, Florida, Nevada, New Hampshire, New Jersey, Rhode Island, and Virginia, ratios were highest for the rural part of the State. The highest ratio for illegitimate births to all white mothers (52.7) was for the larger cities of Vermont.

The highest ratio for illegitimate births to native mothers (55.1) was also for the larger cities of Vermont.

For children of foreign-born mothers, the highest ratio of illegitimate births (111.1 per 1,000 total births) was for the rural districts of Delaware.

Considering only the illegitimate births in each State to mothers of other races, ratios were highest for the larger cities in the majority of States. In 10 States ratios were highest in the smaller cities and in 9 other States the highest ratios were for the rural districts.

STILLBIRTH STATISTICS: 1936

INTRODUCTION

The annual presentation of stillbirth statistics was begun in 1922. Previous to that time the Bureau of the Census had published such data but once, in 1918.

The interpretation of the statistics relating to stillbirths should be made with caution. There is no single definition for "stillbirth" in general use, and the application of the term varies widely in the law and practices of the different States.

Therefore, it is suggested that persons interested in stillbirth statistics study table Q before drawing conclusions from the figures presented in tables relating to stillbirths.

STATE	PERIOD OF UTEROGESTATION TO WHICH A STILLBORN CHILD MUST HAVE ADVANCED BEFORE A CERTIFICATE IS REQUIRED TO BE REGISTERED	
	Period	Authority
Alabama-----		
Arizona-----	Advanced to 5th month-----	
California-----		
Connecticut-----	Not less than 28 weeks-----	
District of Columbia-----	Passed the 5th month-----	
Florida-----		
Georgia-----	Advanced to 5th month-----	
Illinois-----		
Indiana-----	7 months and over-----	
Iowa-----		
Louisiana-----		
Michigan-----		
Minnesota-----		
Mississippi-----		
Nebraska-----		
New Mexico-----		
New York 1/-----	Advanced to 5th month-----	
North Carolina-----		
Oklahoma-----		
Oregon-----		
South Dakota-----		
Tennessee-----		
Texas-----		
Washington-----	Beyond the 7th month-----	
West Virginia-----	Advanced to 5th month-----	
Arkansas-----		
Colorado-----	5 months-----	
Delaware-----	No definite ruling-----	
Idaho-----	4 months-----	
Kansas-----	Passed the 28th week-----	
Kentucky-----	4 1/2 months-----	
Maine-----	5 months-----	
Massachusetts-----	After 4 1/2 months-----	
Missouri-----	Any period-----	
Montana-----	Passed 4th month or 16th week-----	
Nevada-----	6 months-----	
New Hampshire-----	No definite ruling-----	
New Jersey-----	Advanced to 5th month-----	
North Dakota-----	7th month-----	
Ohio-----	4 months-----	
Rhode Island-----	After the 6th month-----	
South Carolina-----	5 months-----	
Utah-----	6 months-----	
Vermont-----	About the 5th month-----	
Virginia-----	5 months-----	
Wisconsin-----	After the 5th month-----	
Wyoming-----	Advanced to 5th month-----	
Maryland-----	Any product of conception-----	Letter to doctors of Maryland Instructions for local registrars
Pennsylvania-----	Passed the 4th month-----	

1/ Exclusive of New York City, where any product of conception is required to be registered.

NOTE.—Connecticut, Illinois, New Jersey, New York, North Carolina, Oregon, Texas, and the District of Columbia report a stillbirth as a stillbirth. In the remaining States a stillbirth is reported either as a birth or as both a birth and a death.

COMPARISON OF STILLBIRTH RATIOS: 1935 AND 1936

In 1936 the highest stillbirth ratio (5.9 per 100 live births) was for Georgia, closely followed by 5.8 for South Carolina. Ratios for the white populations of these States were 4.0 and 3.4, respectively, and for the populations of other races, 8.7 and 8.2, respectively. The next highest ratio (4.9 per 100 live births) was for both Florida and Maryland. In these States a large proportion of the population is of other races, for which the ratios were, respectively, 8.8 and 8.2, whereas the ratios for the white populations were only 3.3 and 4.0, respectively. The lowest stillbirth ratio (1.4 per 100 live births) was for Wyoming. A comparison of the figures for 1936 with those for 1935 shows that ratios were higher in 1936 in only 8 States and lower in 33.

In table R stillbirths per 100 live births are presented by race for certain States, and by cities of 10,000 inhabitants or more, cities of 2,500 to 10,000 inhabitants, and rural districts of each State, for the years 1935 and 1936. In 1936, in the United States, all rates were slightly lower than the corresponding rates for 1935.

Considering the States separately, rates in 1936 were lowest for rural districts in 29 States.

The stillbirth ratio for the population of other races in the United States (6.7 per 100 live births) was more than double that for the white (3.0) and for each State shown by race this marked difference prevailed, the greatest (5.5) being for Florida.

STILLBIRTHS BY MONTHS

Table S shows stillbirths per 100 live births by month of birth for the years 1935 and 1936. A comparison of the ratios for the 2 years shows the differences to be very slight. Rates were lower in 1936 for every month except March, the lowest rate (3.2) being for August and September.

MONTH OF BIRTH	STILLBIRTHS PER 100 LIVE BIRTHS IN THE UNITED STATES IN—	
	1936	1935
Total-----	3.4	3.6
January-----	3.6	3.7
February-----	3.5	5.6

September-----	3.2	3.3
October-----	3.4	5.6
November-----	3.5	3.7
December-----	3.4	3.5

STILLBIRTHS BY AGE OF MOTHER

Table T shows stillbirths per 100 live births, by age of mother, and plainly indicates that as mothers grow older the tendency for stillbirths among them becomes greater, especially after the age of 30. The ratios of 8.0 for mothers 45 to 49 years of age, and 10.3 for those aged 50 or more, are in marked contrast with 2.8 and 2.9 for mothers in the age periods 20 to 24 and 25 to 29 years, respectively.

AGE OF MOTHER	UNITED STATES: 1936	
	Live births	Stillbirths
All ages-----	2,144,790	73,735
10 to 14 years-----	2,938	185
15 to 19 years-----	269,223	9,937
20 to 24 years-----	657,019	18,743
25 to 29 years-----	565,830	16,401
30 to 34 years-----	353,834	12,177
35 to 39 years-----	206,094	9,553
40 to 44 years-----	68,484	4,255
45 to 49 years-----	6,636	534
50 years and over-----	185	17
Not stated-----	4,627	1,928

Table U shows the distribution of births and stillbirths, by age of mother, in the United States.

AGE OF MOTHER	DISTRIBUTION PER 1,000, BY AGE OF MOTHER, IN THE UNITED STATES: 1936	
	Live births	Stillbirths
All ages-----	1,000.0	1,000.0
10 to 14 years-----	1.4	2.5
15 to 19 years-----	125.5	134.8
20 to 24 years-----	311.0	254.3
25 to 29 years-----	263.8	222.4
30 to 34 years-----	165.0	165.1
35 to 39 years-----	96.1	129.6
40 to 44 years-----	31.9	57.7
45 to 49 years-----	5.1	7.2
50 years and over-----	0.1	0.2
Not stated-----	2.2	26.1

STILLBIRTHS BY LEGITIMACY

Table V shows the number of stillbirths, with the ratio to 100 live births, by legitimacy, for cities of 10,000 inhabitants or more in 1930, cities of 2,500 to 10,000, and rural districts of the United States and each State.

Ratios were higher for illegitimate in all States except three—Nevada, South Dakota, and Vermont. In 22 States rates of illegitimacy were highest in the smaller cities and in 9 States the highest rates were for the larger cities.

PERCENT OF STILLBIRTHS FROM CERTAIN CAUSES AT SPECIFIED PERIODS OF UTEROGESTATION

In table W the percentage distribution by sex and by cause is shown for the number of stillbirths reported in seven States, the District of Columbia, and Baltimore, Md., the total number being 15,162. Similar tabulations are not available for other States or cities, as information concerning the cause of stillbirths and the period of gestation is not returned on a sufficient number of transcripts to warrant its tabulation.

Note the much greater preponderance of males in the stillbirths of the first 4 months of uterogestation as compared with those of the later months. The following comments apply to male stillbirths presented for the seventh, eighth, and ninth months of uterogestation, these being the months for which stillbirths are believed to be best reported.

For stillbirths of 7 months, only 17.6 percent were due to causes not specified or unknown, though this percentage would change to 24.6 if the terms "abortion, miscarriage, and premature birth" were included. For stillbirths of 8 and 9 months, 15.5 and 15.3 percent, respectively, were due to unknown or not specified causes.

Of the well-defined causes of stillbirths of 7 months' uterogestation, separation of the placenta was the principal cause, being responsible for 12.2 percent of the total. Next in importance were toxemia of pregnancy and prolapse and compression of cord, each 6.6 percent; malformations, 5.8 percent; and placenta praevia, 5.3 percent.

Of the well-defined causes of 8 months' uterogestation, prolapse and compression of cord was of first importance, re-

sponsible for 15.3 percent of the total. Next in importance were other difficult labor, 11.6 percent; separation of placenta, 7.8 percent; and malformations, 6.1 percent.

Of the well-defined causes of 9 months' uterogestation, prolapse and compression of cord was the principal cause, responsible for 19.1 percent of the total. Next in importance were other difficult labor, 14.1 percent; asphyxia of child, 7.2 percent; malformations, 6.2 percent; and separation of placenta, 5.1 percent.

From table X, which shows the percent of stillbirths at specified periods of uterogestation by sex and cause of stillbirth, it is found that 29.6 percent of the male and 29.8 percent of the female stillbirths reported were at the ninth month, and that for 19 of the 20 groups of causes there were more stillbirths of males than females. Malformations, as usual, was the only cause responsible for more stillbirths of females than males.

As causes of stillbirths among males, albuminuria, nephritis, and other diseases incident to pregnancy played their most important role at the seventh and eighth months; the higher percentages of stillbirths from abortion, miscarriage, and premature birth were credited to the fifth and sixth months; the higher percentages from both eclampsia of pregnancy and toxemia of pregnancy were credited to the seventh, eighth, and ninth months; from traumatism to the fifth and sixth months; from placenta praevia to the seventh months; from separation of placenta to the seventh, eighth, and ninth months; from syphilis to the eighth and ninth months; from other deaths in utero to the eighth month; and for all other causes listed the higher percentages were for the ninth month.

INFANT MORTALITY STATISTICS: 1936

INTRODUCTION

The infant mortality rate is the number of deaths of infants under 1 year of age per 1,000 born alive. In 1936 the rate of infant mortality for the United States was 57.1. This is 1.4 higher than the 1935 rate and is practically equivalent to saying that of every 18 infants born alive 1 dies before reaching the age of 1 year.

INFANT MORTALITY RATES: 1932 TO 1936

Table Y shows, for the years 1932 to 1936, infant mortality rates for each State, and each city having 100,000 or more inhabitants in 1930.

For the States, the rates in 1936 ranged from 42.0 in Connecticut to 121.8 in New Mexico. A comparison of the rates for 1936 with those for 1935 shows that rates in 1936 were higher for all but 15 States. The greatest increases (10.6 and 9.4) were in the rates for West Virginia and Vermont, respectively. The greatest decrease (9.7) was in the rate for North Dakota.

For the 93 cities that had populations in 1930 of 100,000 or more, the infant mortality rates varied from 31.7 in Lynn, Mass., to 104.7 in San Antonio, Tex. In 1936 the rates for 40 cities were lower than in the preceding year and those for 52 cities were higher. The greatest decreases were 38.8 in the rate for Lynn, Mass., and 22.9 for El Paso, Tex.

The greatest increase (21.4) was in the rate for Birmingham, Ala.

1/ Exclusive of stillbirths.

2/ Exclusive of Texas in 1932. (See tables A and C.)

3/ Not added to the registration area until a later date.

INFANT MORTALITY RATES FOR CITIES AND RURAL DISTRICTS

In table Z the infant mortality rates of 1917 and 1936 in the registration area of 1917 are shown for cities of 10,000 inhabitants or more and for smaller cities and rural districts combined. There was in this interval a much greater improvement in the rate for larger cities than in that for the smaller cities and rural districts, the table showing a decrease of 47.2 in the former rate as compared with 33.0 in the latter. This greater decline for the larger cities was largely due to the greater decrease (19.7) in the rate from diarrhea and enteritis. Both in the larger cities and in the smaller cities and rural districts injury at birth was the only cause which produced greater infant mortality in 1936 than in 1917.

1/ Exclusive of stillbirths.

2/ Excludes lack of care, desertion, etc., in 1936.

3/ Includes lack of care, desertion, etc., in 1936.

4/ Less than one-tenth of 1 per 1,000 births.

Table AA presents infant mortality rates, by sex, for certain subdivisions of the first year of life, for the class of cities having 10,000 inhabitants or more, and for smaller cities combined with rural districts, in the birth registration area of 1917 (exclusive of Rhode Island), from 1930 to 1936. The table shows the difference in rates for this 6-year interval to be 9.7 per 1,000 for cities of 10,000 or more, and 9.9 per 1,000 for the smaller cities and rural districts.

The table also shows that in 1936 rates under 1 year were, on the whole, slightly higher than in 1935.

COMPARISON OF INFANT MORTALITY RATES: 1931 TO 1936

Table AB shows infant mortality rates from certain important causes for each year from 1931 to 1936. A comparison of the rates for 1936 with those for 1935 shows the differences in the rates to be very slight in both the expanding area and in the area of 1915.

INFANT MORTALITY BY RACE

Table AC presents infant mortality rates by age, sex, and race.

With a rate of 57.1 per 1,000 live births for the total, rates for white and Negro children and for those of other races were 52.9, 86.1, and 120.0, respectively.

1/ Exclusive of stillbirths.

2/ Less than one-tenth of 1 per 1,000 births.

BIRTHS, STILLBIRTHS, AND INFANT MORTALITY

For "under 1 day", rates for children of other races were lower than those for white and Negro children, but in every other instance rates for the white were lower than those for both Negroes and other races.

For the first two age-periods—under 1 day and 1 day—rates for children of other races were lower than those for Negroes but for all other ages rates for Negroes were lower than those for other races.

Except for 5 ages—5, 6, 8, 9, and 11 months for other races—rates throughout the table are higher for males than for females.

^{1/} Exclusive of stillbirths.

Table AD presents rates of infant mortality, by cause and sex, for white and Negro children and for those of other races, in the United States in 1936.

The table shows that the only diseases causing a higher mortality among white children than among Negroes were erysipelas, congenital malformations, and injury at birth. A comparison of the rates for white children with those for other races shows there was higher mortality among the white from scarlet fever, diphtheria, congenital malformations, premature birth, and injury at birth.

INFANT MORTALITY RATES OF FOREIGN COUNTRIES

Infant mortality rates for the United States and certain foreign countries are presented in tables AE, AF, and AG.

For 23 countries rates are shown for both 1935 and 1936. Of these, all but 9 had lower rates in 1936, namely, the United States, Australia, Belgium, Chile, England and Wales, Scotland, Irish Free State, Lithuania, and Sweden.

New Zealand, in 1936, had a rate of 31.0 or 26.1 lower than the 1936 rate for the United States. Of this difference, 59 percent is found in the rates for the first 3 months of life, and the other 41 percent is distributed over the other 9 months. Considering the difference by cause of death, it is found that the rates in the United States were higher for all but three causes. The rates in the United States from congenital debility and other diseases of early infancy, congenital malformations, and whooping-cough were 0.6, 0.2, and 0.2, respectively, lower than the rates for the same causes in New Zealand, and the rates for diphtheria and convulsions were the same in both countries.

The diseases chiefly responsible for the difference between the rates of the two countries are premature birth, diarrhea and enteritis, bronchitis and bronchopneumonia, and unknown or ill-defined diseases.

Chile and British Guiana, in 1936, had rates of 252.2 and 120.5, or 195.1 and 63.4, respectively, higher than that for the United States. In Chile, 29 percent of the difference was caused by the high rates from influenza and pneumonia, and bronchitis and bronchopneumonia, 26 percent from congenital debility and other diseases of early infancy, and 18 percent from diarrhea and enteritis.

British Guiana's high mortality from congenital debility and other diseases of early infancy was responsible for 50 percent of the difference between the rates of the two countries, and the large number of deaths from diarrhea and enteritis and from bronchitis and bronchopneumonia caused 12 and 8 percent, respectively, of the difference.

BIRTHS, STILLBIRTHS, AND INFANT MORTALITY

TABLE 21.—DEATHS (EXCLUSIVE OF STILLBIRTHS) FROM IMPORTANT CAUSES, BY CERTAIN SUBDIVISIONS OF THE FIRST YEAR OF LIFE: 1936

(Numbers after causes of death correspond to those of the detailed International List of Causes of Death. Refer to this list for complete definition of each cause and for causes included in "All other causes." Washington, D. C., and cities having 500,000 inhabitants or more on April 1, 1930, are included, and those with a minimum of 25,000 inhabitants other than white are shown by race.)

SUPPLEMENT

HAWAII

The Territory of Hawaii was admitted to the birth registration area of the United States in 1929. From this Territory, in 1936, 8,581 births were reported. Of these, 3,059, or 36 percent, were Japanese; 2,016, or 23 percent, were part Hawaiian; 1,484, or 17 percent, were Caucasian; 1,157, or 13 percent, were Filipinos; 469, or 5 percent, were Chinese; and 283, or 3 percent, were Hawaiian.

Deaths under 1 year occurring in Hawaii in 1936 numbered 627, indicating an infant mortality rate of 73.1 per 1,000 live births. One hundred and thirty-eight, or 22 percent, of these deaths were caused by premature birth; 106, or 17 percent, by bronchopneumonia; and 69, or 11 percent, by diarrhea and enteritis. The rates of these 3 causes were 16.1, 12.4, and 8.0, respectively.

VIRGIN ISLANDS

The Virgin Islands—St. Croix, St. Thomas, and St. John—were admitted to the registration area of the United States in 1924.

In 1936, 664 births were reported in these islands, and of this number the Negro births represented 71 percent. Deaths under 1 year numbered 70 and represent an infant mortality rate of 105.4. This was 65.3 per 1,000 lower than the rate (170.7) for 1935. Thirty-nine percent of all deaths occurring among infants under 1 year of age were caused by diarrhea and enteritis, 14 percent by premature birth, and 10 percent by bronchopneumonia, the rates from these causes being 40.7, 15.1, and 10.5, respectively, per 1,000 live births. The infant mortality rate for Negroes was 117.3 or 66.4 lower than the corresponding rate (183.7) for 1935.
